

90% OF INVENTORY DISCREPANCIES CAUGHT BEFORE IMPACTING THE CUSTOMER

OVERVIEW

ODW Logistics partnered with Dexory to modernize inventory management through autonomous scanning and real-time visibility. By replacing manual audit processes with continuous data capture, ODW improved inventory accuracy, reduced fulfillment risk, and enhanced operational responsiveness.

THE CHALLENGE

A full warehouse audit required weeks to complete, increasing the risk of inventory discrepancies impacting order fulfillment. Teams lacked real-time insight to proactively resolve issues leading to resources being allocated to find problems instead of preventing them.

THE SOLUTION

ODW implemented a real-time inventory visibility solution that continuously validates inventory locations and identifies discrepancies before they impact fulfillment operations, providing teams with actionable insights without disrupting daily operations.

- Automated inventory validation across storage locations.
- Continuous discrepancy monitoring.
- Integration within existing warehouse workflows.
- Deployment completed in two weeks.

THE RESULTS

< 24 HRS
1M sq. ft. audited in less than 24 hours

90%
of inventory issues identified before picking

2 WEEK
Deployment completed with minimal operations disruption

Teams now spend less time searching for inventory issues and more time resolving them, reducing downstream disruptions. Following the success of the initial deployment, ODW expanded the program with four additional Dexory units to further enhance inventory visibility across its network.
